

Who is responsible for conserving & protecting biodiversity?

A multi stakeholder approach in conserving and protecting biodiversity areas is a key approach in the protected areas system. This means everybody must be involved and not rely only on environmental offices, the local government units with jurisdiction over the KBAs, or the indigenous communities and other forest dependent communities living in or near the areas.

Everyone has a stake in biodiversity conservation. Environmental workers, researchers, local residents, and scientists play a big role in defining the key biodiversity areas and identifying the diversity of life of plants and animals living therein. Because if people are made aware about what they are conserving and protecting then they will not become part of its destruction.

If we value our lives, we must learn to value what our lives depend on. Finding our connection to the variety of life around us is the first step in protecting and enhancing biodiversity. After all, Biodiversity is Life!

Biodiversity Conservation is Everyone's Responsibility
